Ischemic Optic Neuropathies Sohan Singh Hayreh 2011-08-28 Ischemic optic neuropathy, often referred to as a stroke of the optic nerve, is one of the major causes of visual impairment or loss of vision. Yet it is a highly controversial and confusing subject because of the general lack of in-depth scientific understanding of the subject. In this book the leading authority in the field describes in detail the current knowledge about the different forms of the often devastating disease. Insights into the underlying pathogenesis and peculiar clinical features are given, leading the reader to the most appropriate way of management. This information will help any physician dealing with patients who suffer from sudden loss of vision.

Ocular Blood Flow Hedwig J. Kaiser 1996-01-01 This book is a synopsis of up-to-date knowledge on the quantification of ocular blood perfusion and originates from expert lectures held at the 1995 Glaucoma Meeting in Switzerland. In the first section, a profound overview of the anatomy, physiology and pathophysiology of ocular perfusion enables the reader to gain distinct new insights into the pathogenesis of ocular diseases. The second part of the publication describes the different measuring methods that are currently applied in clinical practice and in research. It has been written by a team of leading researchers with the aim of bringing their findings to the attention of those working directly with patients, in particular the ophthalmologist in the clinic or private practice.

Vascular Considerations in Glaucoma Alon Harris 2013-03-28

The Ocular Circulation Jeffrey W. Kiel 2011-02-01 This presentation describes the unique anatomy and physiology of the vascular beds that serve the eye. The needs for an unobstructed light path from the cornea to the retina and a relatively fixed corneal curvature and distance between refractive structures pose significant challenges for the vasculature to provide nutrients and remove metabolic waste. To meet these needs, the ocular vascular beds are confined to the periphery of the posterior two thirds of the eye and a surrogate circulation provides a continuous flow of aqueous humor to nourish the avascular cornea, lens and vitreous compartment. The production of aqueous humor (and its ease of egress from the eye) also generates the intraocular pressure (IOP), which maintains the shape of the eye. However, the IOP also exerts a compressing force on the ocular blood vessels that is higher than elsewhere in the body. This is particularly true for the intraocular veins, which must have a pressure higher than IOP to remain patent, and so the IOP is the effective venous pressure for the intraocular vascular beds. Consequently, the ocular circulation operates at a lower perfusion pressure gradient than elsewhere in the body and is more at risk for ischemic damage when faced with low arterial pressure, particularly if IOP is elevated. This risk and the specialized tissues of the eye give rise to the fascinating physiology of the ocular circulations.

Ischemia and Loss of Vascular Autoregulation in Ocular and Cerebral Diseases Maurice E. Langham 2010-01-23 From the introduction: " The purpose of the present book is to bring together in a coherent manner new knowledge gained from research over the past 50 years on the physiology of intraocular pressure, ocular blood flow and the relation of these fundamental parameters to early diagnosis and therapy of vascular diseases of the eye and brain. It will be evident to the reader that the presentation is influenced significantly by the

author ' s own research. My justification is that by good fortune I have spent many years with superb collaboration helping solve outstanding problems of ocular physiology. This knowledge has increased understanding of the parameters underlying the onset of ischemia and the loss of autoregulation associated with common ocular disease and thereby led to new methods of diagnosis and therapy. ”

Ocular Fluid Dynamics Giovanna Guidoboni 2019-11-25 The chapters in this contributed volume showcase current theoretical approaches in the modeling of ocular fluid dynamics in health and disease. By including chapters written by experts from a variety of fields, this volume will help foster a genuinely collaborative spirit between clinical and research scientists. It vividly illustrates the advantages of clinical and experimental methods, data-driven modeling, and physically-based modeling, while also detailing the limitations of each approach. Blood, aqueous humor, vitreous humor, tear film, and cerebrospinal fluid each have a section dedicated to their anatomy and physiology, pathological conditions, imaging techniques, and mathematical modeling. Because each fluid receives a thorough analysis from experts in their respective fields, this volume stands out among the existing ophthalmology literature. Ocular Fluid Dynamics is ideal for current and future graduate students in applied mathematics and ophthalmology who wish to explore the field by investigating open questions, experimental technologies, and mathematical models. It will also be a valuable resource for researchers in mathematics, engineering, physics, computer science, chemistry, ophthalmology, and more.

The Impact of Tonometer Measurement Error on Ocular Pulse Amplitude and the Estimation of Pulsatile Ocular Blood Volume Ryan H. Somogye 2021 The complete ocular pressure waveform consists of intraocular pressure (IOP) and ocular pulse amplitude (OPA). IOP is the steady-state component and is related to aqueous humor production and flow in the anterior chamber. OPA is the pulsatile component and drives the arterial pulse pressure, pushing blood into the eye with every cardiac cycle. OPA is positively correlated with IOP and negatively correlated with axial length (AL) and ocular rigidity (OR). IOP (thus OPA) is positively correlated with central corneal thickness (CCT) when measured with a Goldmann-type tonometer that applanates the cornea. OPA can be used to estimate pulsatile ocular blood volume (POBV), so it is important to understand the effect corneal biomechanics and tonometer-specific error have on measurements of the ocular pressure waveform. An electronic interface was constructed to allow real-time recording of the ocular pressure waveform measured with a pneumatometer (PNT) using a standard bedside patient monitor. This system can capture the complete ocular pressure waveform signal simultaneously with other invasive pressures, ECG, and other standard patient monitor signals. Presently, PNTs display IOP and OPA averaged over a given sample period and print a paper strip chart of the ocular pressure waveform. The novel electronic interface allows quick and more accurate recording of the PNT output waveform for post-processing and comparison to other waveforms. The electronically recorded data from the PNT interface was shown to highly correlate to the strip chart data without the presence of the errors inherent in scanning paper and processing images. This analog interface was used to conduct a tonometer measurement error study between the PNT and the dynamic contour tonometer (DCT). The measurement target of this study were an artificial cornea (lacking the non-linear biomechanical properties of a real cornea) fed by a mechanically set IOP and OPA. The differences in measurement error between the PNT and DCT using the artificial cornea were dependent on IOP. However, the measurements of both tonometers were significantly correlated on human subject data. This indicated that the PNT may be calibrated to mimic the error exhibited by the Goldmann applanation tonometer (GAT) in the clinically-relevant range of IOP. The characterization of the PNT error in the artificial cornea allows a better understanding of the effect of corneal biomechanics on OPA. A data set from an accuracy study on the DCT provided measurements of IOP, OPA, and AL at a range of IOPs set by a manometer. A significant correlation of OR to AL has been established and used to estimate OR from the data set. Friedenwald's pressure-volume relationship was used to calculate a pulsatile ocular blood volume (POBV) estimate, similar to POBF but with no time component. POBV was found to be significantly correlated to both OPA and OPA/IOP, which is the best surrogate factor for POBF available in the data set. Characterizing the measurement error of tonometers on an artificial cornea compared to human subject data provides a better understanding of how to interpret changes in OPA in the context of IOP and corneal biomechanics. Combining this understanding with the development of a method to estimate POBV allows tonometers capable of measuring IOP and OPA to provide an easily calculated,

clinically useful estimate of ocular blood flow.

Ocular Rigidity, Biomechanics and Hydrodynamics of the Eye Ioannis Pallikaris 2021-05-26 This book focuses on the concept of ocular rigidity, the biomechanical properties and hydrodynamics of the human eye. The basics of anatomy and physiology are explored and the relevant data for the clinician are emphasized throughout the book. The engineering aspects as well as the clinical interpretation are presented to provide context. Ocular Rigidity, Biomechanics and Hydrodynamics of the Eye summarises recent evidence on ocular rigidity, but also provides a complete presentation of the data so far. The authors have recently worked on ocular rigidity corneal and globe biomechanics and hydrodynamics and the new, up-to-date data on the subject are highlighted in each chapter. The aim is to provide the framework or the understanding of these parameters and to determine their relevance in health and disease. This book will be an essential read for all practicing ophthalmologists looking to gain a more in-depth understanding of this interesting area of research particularly in refractive surgery and glaucoma.

Plethysmography Thomas V. Holohan 1996-06-01 Plethysmography, a semi quantitative method of measuring segmental blood flow and velocity in the carotid and peripheral vascular systems, is safe, easy to perform, and inexpensive. Impedance, strain guage, air, and photoelectric plethysmographic methods are assessed for their relative safety, efficacy, and clinical utility in diagnosing vascular disease. Impedance, strain guage, and photoplethysmography methods can be used for the initial eval. of acute and chronic venous insufficiency, although these tests are not reliable in predicting venous disease in the presence of nonobstructive thrombi and comorbid conditions.

Ocular Toxicology Keith Green 2012-12-06 On behalf of the editorial board and the organizing committee of the 4th congress of the International Society of Ocular Toxicology (I SOT), held in AnnecyNeyrier du Lac, France, October 9 -13, 1994, we are pleased to present to the ocular toxicology community this indexed volume of our congress proceedings. The 4th congress was designed primarily to facilitate and update the knowledge in ocular electrophysiology and ocular pharmacokinetics, in both the clinical and preclinical aspects. The outcome of this 4th congress, established in this volume, is a useful contribution to the methodology in both fields and will hopefully assist in the evaluation and interpretation of ocular findings recorded in animal studies on drugs and other chemicals, in order to protect

human health. Undoubtedly, work on the mechanisms of ocular toxicology in the process of pharmaceutical development must continue and these proceedings, embodying the presented papers, will add to the data base. The editors, the congress organizing committee and the members of the International Society of Ocular Toxicology thank the speakers who gave their time, knowledge, and expertise to assist us in this project. The following manuscripts contain the main substance of each of the platform presentations and, in some cases, much more. Moreover, our thanks go to all the participants coming from a range of background-regulatory, academic and industrial -for their attention and excellent contributions during the discussion.

Methods of Estimation of Ocular Blood Flow Nithiyantham Palanisamy 2012 Cataract, Glaucoma, Age-related macular degeneration, and Diabetic retinopathy are the greatest threat to vision problems in humans. These diseases are predicted well in advance by measuring the retinal blood flow. The development of Ocular fundus reflectometry and Laser Doppler flowmetry in mid 1970's to investigate the blood flow in the posterior segment of human eye has provided much useful information on the physiology of ocular blood flow. These methods suffers some drawbacks like: (i) it does not provide absolute value of blood flow (ii) uncertainty in knowing the sampling volume (iii) optical properties of ocular tissue (iv) angle of impinging and scattering beams (v) changes in pupil diameter. This book provides the experimental results of effect of one drop of timolol on heart rate, IOP and choroidal blood flow (ChBF). In the book, we proposed use of an artificial pupil to measure the effect of various pharmacological agents on choroidal blood flow (ChBF) using LDF reduces the variability and increases the sensitivity of the technique to detect the changes in ChBF
